Some people are skeptical and do not trust sites that make big promises but once they obtain thorough and easy to read information they realize that their skepticism is not founded. Obtaining the prompt information saves the time and the hassle of getting this done by yourself.

Why go solar? Positive environmental impact should really be the first thing that comes to your mind. This means reducing carbon emissions which helps our climate.

From the economic point of view you can start saving money on your electric bill and increase the overall value of your home.

Investing in solar will also free you from utility policy changes and it will also give your home protection when the grid goes down making you energy independent in the process.

It also has to be mentioned that the US Federal Government offers a 30% federal solar tax credit for any residential solar panel system installed. This program has been extended until December 31, 2020.

Remember, solar is now more affordable than ever before. Do your share and go green.
